

EMIHS 5-minute Lineup Drill

Hangings that RESULT in Cardiac Arrest

- SPASM** and **Floor of Care**
- Consider **Advanced Airway** earlier than in other arrests
- On-Scene resuscitation until **3rd Epinephrine**
- At least **15 2-minute cycles** of CPR before **TOR**
- Spinal Motion Restriction**

- Post ROSC Care**
- Trauma center destination

Why?

- The physiology of the arrest is usually asphyxia (lack of oxygen) and responds to the medical arrest treatments
- At the same time, the patient may have a neck injury that is best managed at a trauma center
